Total water requirement for Phase-I, Phase-II & III will be 16,505 cum/day. This includes make-up water for cooling, make –up water for boiler, DM plant regeneration water, Air conditioning & ventilation system and domestic water of plant & township. At present , generated effluent from different units is collected in settling tanks through connecting drainage system followed by settling tanks .From settling tanks it is being treated into settling pond by adding chemicals (if required) . Stored/ collected effluent from settling pond is being further treated through Water Treatment Plant (WTP Capacity 300 M³) followed by thickener, filter units, chemical dosing etc. Treated water from WTP is being reused into process, kiln cooling, horticulture purpose etc.

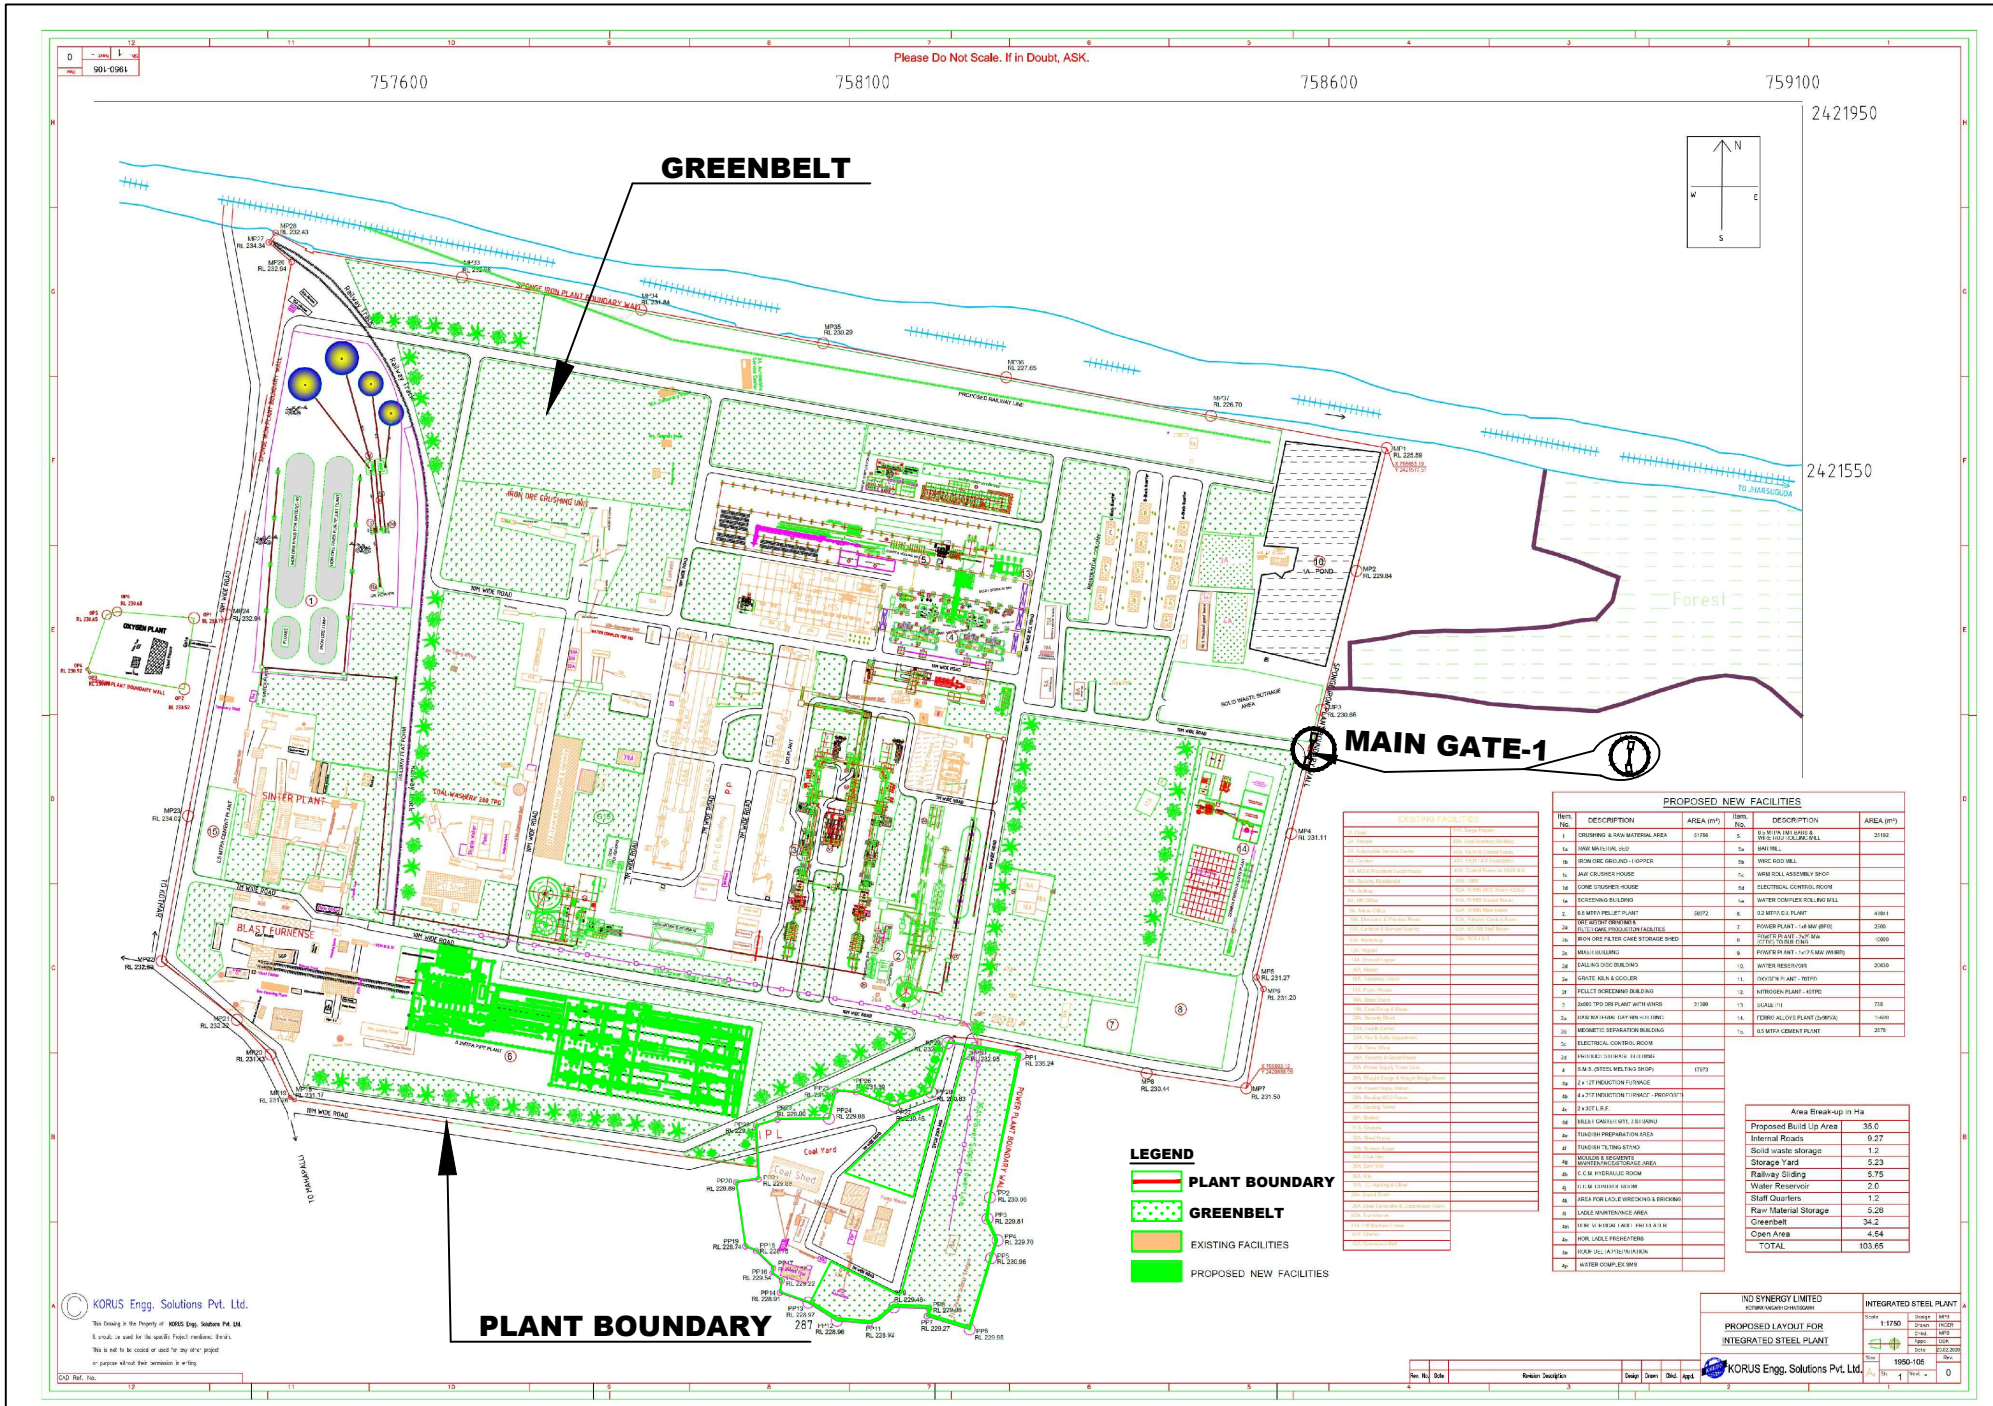

Generated domestic effluent from canteen and residential area is being treated through provided septic tanks and soak pits. Generated quantity of domestic effluent is very less for which STP is not required. Sewage Treatment Plant (STP) will be installed in future subject to generation of sufficient generated effluent.
